Materials	ABS
Parts NO	R1160350/R1160360
Packing	Box
Shipping	Sea/Air
Place of origin	Guangzhou,China

The motorcycle handlebar switch is a switch device installed on the motorcycle handlebar and is used to control various functions and electrical equipment of the motorcycle. A handlebar switch usually consists of a plastic shell and electronic components inside. Different functions are activated by pressing or flipping the switch.

The main functions of the motorcycle handlebar switch include:

Lighting control: There are usually switches on the handlebar switch that control the headlights, rear taillights, turn signals and other lights. By flipping or pressing the corresponding switch, the rider can control the motorcycle's light status to provide lighting and indication signals.

Turn indicator: There is usually a switch on the handlebar switch that controls the turn indicator (turn signal). By pressing the switch, the rider can turn the turn indicator on or off to indicate the motorcycle's steering intentions to other vehicles and pedestrians.

Horn: There is usually a switch on the handlebar switch for controlling the horn. By pressing a switch, the rider can emit a horn sound to alert other vehicles or pedestrians.

Start switch: There is usually a start switch on the handlebar switch, which is used to start or stop the engine. The rider needs to press or flip the starter switch to start the motorcycle's engine.

Power switch: Some motorcycle handlebar switches can also have a power switch to control the power on or off of the motorcycle's electrical system.
