The rectifier of a tricycle is an electronic device used to convert alternating current into direct current and provide a stable power supply to the electric system and charging system. Rectifiers are generally used in charging systems to convert alternating current generated by generators into direct current to charge batteries and drive electric equipment.

In a three-wheeler, the main function of the rectifier is to convert the alternating current generated by the generator into direct current to provide power for charging the battery and driving electric equipment, such as lights, horns, ignition systems, etc. A rectifier usually consists of a series of diodes that convert alternating current into unidirectional direct current.

The rectifier also has the function of stabilizing current and voltage to ensure the normal operation of the electric system and charging system. It can filter out fluctuations and noise in AC power and provide a stable DC power supply. This is important to protect batteries and electrical equipment from voltage fluctuations.
