The motorcycle sprocket is one of the key components in the motorcycle transmission system and is used to transmit power and driving force to the rear wheel of the motorcycle.

Function: The motorcycle sprocket transmits the engine power to the rear wheel through meshing with the drive chain. Depending on the design and purpose of the motorcycle, they can have a front sprocket (front drive) and a rear sprocket (rear drive). The gears on the sprocket mesh with the pins of the chain, turning the sprocket to rotate the chain, thereby transmitting power to the rear wheel.

The motorcycle chain is a key component in the motorcycle transmission system. It is used to transmit the power of the engine to the rear wheel and drive the motorcycle forward.

Function: The motorcycle chain transmits the engine power to the rear wheel by meshing with the gears of the front sprocket and the rear sprocket. The rotation of the chain converts power into rotational torque, causing the rear wheel to rotate, thereby propelling the motorcycle forward.

The motorcycle chain and sprocket kit is a set of driving accessories composed of a sprocket, a chain and a sprocket bolts.
