Motorcycle starter motor, also known as a starter, is an electric motor that is responsible for initiating the engine's combustion process. Its primary function is to crank the engine and bring it to a speed where it can start running on its own.

When a motorcycle rider activates the ignition switch or presses the starter button, an electrical current is sent to the starter motor. The starter motor then engages with the engine's flywheel or starter clutch assembly, which is connected to the crankshaft. As the starter motor spins, it rotates the engine's crankshaft, causing the pistons to move up and down and initiating the combustion cycle.
