The motorcycle timing chain, also known as the cam chain or camshaft chain, is a crucial component in the engine's valve train system. Its primary function is to synchronize the rotation of the crankshaft and the camshaft(s) to ensure proper valve timing.

The timing chain is responsible for controlling the opening and closing of the engine's intake and exhaust valves at the precise moments in the combustion cycle. It transfers the rotational power from the crankshaft to the camshaft(s), which in turn actuates the valves.

Motorcycle timing chains are typically made of metal links or plates and are designed to be durable and long-lasting. Unlike timing belts, which are made of rubber and require periodic replacement, timing chains are built to withstand the demanding conditions of the engine and do not usually require regular maintenance or replacement.
