WAY-C

The starter relay in a tricycle is an electrical component that plays a crucial role in starting the engine. It serves as a switch that controls the flow of electrical current from the battery to the starter motor.

When you turn the ignition key or press the start button on a tricycle equipped with an electric starter, the starter relay receives a signal from the ignition switch or the start button. This signal activates the relay, allowing high current from the battery to flow through the relay to the starter motor. The starter motor then engages with the engine's flywheel or starter clutch, cranking the engine and initiating the combustion process.

The starter relay is designed to handle high current flows, as the starter motor requires a significant amount of power to turn the engine over. It typically consists of a coil, contacts, and a solenoid. The coil is energized when the ignition switch or start button is activated, creating a magnetic field that pulls the contacts together, completing the circuit and allowing current to flow to the starter motor.
