Products Description

Product name	Horn
Model	TVS APACHE RTR 200 4V
Materials	Alloy
Parts NO	N9160850
Packing	Box
Shipping	Sea/Air
Place of origin	Guangzhou,China

Motorcycle horn is a device used to produce a loud audible sound as a warning signal or to attract attention while riding a motorcycle. It is an essential safety feature that helps alert other road users to your presence in various situations.

The motorcycle horn is typically located near the front of the motorcycle and is controlled by a button or switch on the handlebars for easy access. When the button or switch is pressed, it activates the horn and causes it to emit a loud sound.

The sound produced by a motorcycle horn is usually a single-tone, sharp sound designed to be easily noticeable and distinguishable from other sounds on the road. The volume and intensity of the horn's sound can vary depending on the specific design and model of the motorcycle.

Motorcycle horns are generally powered by the motorcycle's electrical system. When the horn button is pressed, it completes an electrical circuit that triggers a solenoid or electromagnetic mechanism inside the horn. This, in turn, causes a diaphragm or set of metal plates to vibrate rapidly, producing the sound.

It's important to note that the use of the motorcycle horn should be done in a responsible and considerate manner, adhering to local traffic laws and regulations. The horn should be used to alert and warn other road users as necessary, such as when overtaking, in emergency situations, or to indicate your presence in potential collision scenarios.
