The main function of the motorcycle high-voltage package is to generate high-voltage electricity to ignite the combustible mixture in the cylinder through the spark plug. To put it simply, it is a miniature transformer that converts low voltage into high voltage. When the engine rotates at high speed, its voltage can reach about 20,000 volts.

The motorcycle high-voltage package is a step-up transformer that increases the 6V or 12V voltage generated by the motorcycle generator to 12,000V and sends it to the spark plug for ignition.

The working principle of the high-voltage package is to convert DC into AC through an oscillator, boost the voltage through a boost circuit and rectify it into high-voltage DC. When the voltage rises to a certain value, it supplies power to the igniter.
