District Guangzhou,China

HONDA CB125 motorcycle gear lever, also known as the shift lever or gear shifter, is a component that allows the rider to change gears on a motorcycle equipped with a manual transmission. It is typically located on the left side of the motorcycle's engine and is operated by the rider's left foot.

The gear lever is attached to a shift shaft that extends into the motorcycle's transmission. When the rider uses their foot to shift gears, the gear lever translates the input into a rotational movement of the shift shaft, which in turn engages different gears within the transmission.

The gear lever is usually designed with a folding or pivoting mechanism. This allows it to move up and down smoothly, even if the motorcycle leans during cornering or in the event of contact with the ground. The folding or pivoting feature helps prevent damage to the gear lever or transmission in case of a fall or impact.
